

REPLACED
ART 34 AMDT

11

Claims

1. A method for updating a firmware of a mobile device belonging to a network,
characterized in that the method comprises steps of
 - transmitting update data from a network unit by a mobile device (403), to
5 which there is connected a logic, external memory unit,
 - storing the update data in the external memory unit (203, 303, 406) of the
mobile device, and
 - programming the stored update data in the permanent memory unit (204, 306,
408) of the mobile device, according to the programming logics provided in
10 the mobile device.
2. A method according to claim 1, **characterized** in that it comprises a step of
transmitting the update data from the network unit to the mobile device as a
response to a certain function that triggers the transmission, said function being one
of the following: choosing from the network unit's menu (402) by a user, choosing
15 from the mobile device's menu (201) by a user, an appearing of new update data to
the network unit, or an outdating (301) of the firmware of the mobile device.
3. A method according to claim 1, **characterized** in that the logic, external
memory unit is connected to the mobile device by means of an external memory bus
(105).
- 20 4. A method according to claim 1, **characterized** in that it comprises a step of
transmitting the update data by the mobile device (403), where the update data is
converted to be compatible with the memory unit and with the memory bus (405) to
be connected thereto, whereafter the converted update data is transmitted to the
external memory unit along the memory bus (406).
- 25 5. A method according to claim 1, **characterized** in that it comprises a step of
transmitting the update data by a mobile device, through which the update data is
directly transmitted further to the external memory bus of the mobile device along a
memory bus (203).
- 30 6. A method according to claim 1, **characterized** in that it comprises a step of
programming the update data stored in the external memory unit in the mobile
device, when the mobile device is switched on for the next time (304, 307, 407,
409).

7. A method according to claim 1, **characterized** in that it comprises a step of copying the programming logics for programming the update data from an external memory unit to the permanent memory unit of the mobile device prior to programming the update data (305).
- 5 8. A method according to claim 1, **characterized** in that it comprises a step of storing the programming logics for updating the update data from the permanent memory of the mobile device to the RAM memory of the mobile device prior to programming the update data.
9. An arrangement for updating a firmware of a mobile device belonging to a
10 network, **characterized** in that the arrangement includes
- an external memory unit (106) for storing the update data,
 - means for transmitting the update data from a network (107) unit to the external memory unit (106) of the mobile device,
 - means for storing the update data to the external memory unit (106) of the
15 mobile device, and
 - means for programming the stored update data to the permanent memory unit (102) of the mobile device by means of a programming driver provided in the mobile device.
10. An arrangement according to claim 9, **characterized** in that the mobile device
20 includes an external bus (105) for connecting a logic, external memory unit (106) to the mobile device (101).
11. An arrangement according to claim 9, **characterized** in that the mobile device includes means for converting the update data into a form (104, 105) required by the external memory unit.
- 25 12. An arrangement according to claim 9, **characterized** in that the mobile device includes means for copying the programming driver to its permanent memory unit (102) from the external memory unit (106) prior to programming the update data.
13. An arrangement according to claim 9, **characterized** in that said means are programmable means.
